

Research Quality Resting Energy Expenditure Measurements

Automatic Calculation of VO₂, VCO₂, RQ, Kcals, CHO, Lipids Using either Mask or Canopy (Hood) with unequaled accuracy

Vista-MX/REE System is a modular system for Resting Energy Expenditure measurements (REE, BMR, RMR) as well as Cardio-Pulmonary Exercise Stress (VO₂) testing. It consists of our model 17590 Vista-MX, model 17585 Canopy Module and model 17597 Canopy Calibrator.

It may be used as a desktop system with your own computer or with our mobile cart, including IBM-compatible computer, as shown on the right.

Vista-MX/REE uses a new calibration method that achieves unequaled accuracy for resting measurements:

Calibration with the Model 17597 Canopy Calibrator Module guarantees VO₂ and VCO₂ accuracy of ±2%

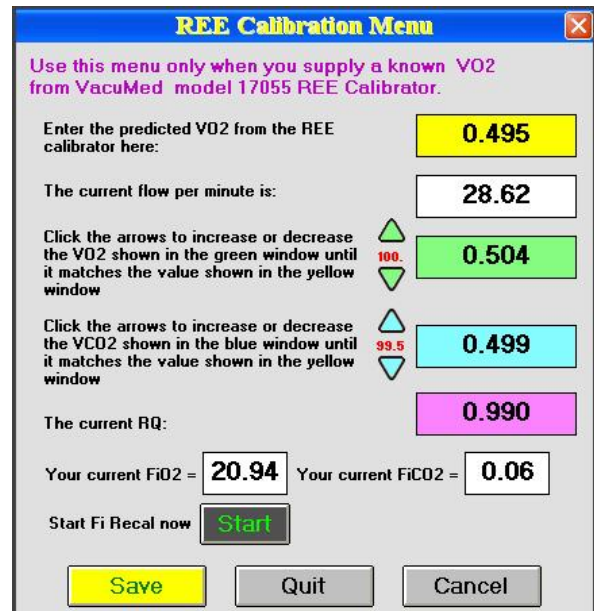

We achieve this accuracy in two ways:

1. We actually measure the canopy flow rate, rather than depend on a fixed orifice maintaining a fixed flow forever.
2. We provide a metabolic flow mixture of known VO₂ from the 17055 Canopy Metabolic Calibrator, then fine-tune the VO₂ calculation so that it matches the input, as shown in the REE Calibration Menu.

The Canopy Metabolic Calibration Module

Included is our proven Windows-based TurboFit software which offers unparalleled ease of operation and virtually unlimited user definable graphic and text display options, workload protocols, parameter selection and reports; a USB computer interface, a permanently calibrated turbine flowmeter, on-line temperature and barometric pressure sensors, and either canopy (hood), mask or mouthpiece patient interface.
